

P2104

ANTI-VIBRATION COMPONENTS

Material

Rubber on black zinc plated steel (rubber hardness 40-70 Shore A).

Technical Notes

This mount has a v-shaped design providing high deflections for relatively low

loads. This means that the natural frequency is low and ideal for engines which normally work at idle speed.

Tips

It is used in applications where the load to be supported is low, and where high

deflection is required to reach high vibration isolation levels. Marine engines, small vehicles or machines, small and medium sized generator sets.

Recommendations for Machine Mounts

The machine mounts should be installed between two parallel and perfectly flat surfaces. Mounts operating tilted or twisted do not work properly. This may be due to incorrect alignment, tolerances in the building of the structure or over-tightened torque during the installation of the anti-vibration mounts.
